3. Project Design Phase

COMIC CRAFT – AI COMIC STORY USING GEMINI MODEL

• System Architecture: User Interface → Application Logic → Gemini API → Generated Story Data → Comic Story Presentation.

• Major Modules: User Input Module; Prompt Processing Module; Gemini AI Integration; Story/Scene Generator; Character and Dialogue Generator; Result Display Module; Error Handling Module.

• Data Flow: User enters an idea → application validates the input → prompt is prepared → Gemini generates structured content → application formats the result → comic story is displayed.

• Prompt Design: Prompts should clearly define the requested story structure, characters, scenes, dialogue, tone, and output format so the generated response can be processed consistently.

• Interface Design: The interface should provide a clear prompt area, generate control, progress/error feedback, and an organized presentation of the resulting comic story.

• Security Design: API keys should be stored in environment variables or another protected configuration mechanism and should not be committed to a public repository.
