5. Project Development Phase

COMIC CRAFT – AI COMIC STORY USING GEMINI MODEL

• Application Development: Implement the user interface, input handling, application logic, Gemini API communication, and generated-story presentation.

• Gemini Integration: Configure the Google Gemini API and send carefully designed prompts containing the user's comic-story requirements.

• Story Generation: Request a structured story containing elements such as title, characters, scenes, narration, dialogue, and visual descriptions.

• Output Processing: Validate and format the AI response so that scenes and panels can be displayed in a clear comic-story layout.

• User Experience: Provide understandable input instructions, generation feedback, error messages, and an organized result view.

• Configuration: Store API credentials in environment variables and provide a safe configuration template rather than exposing secrets in the repository.

• Repository Reference: The project can be maintained in the supplied Comic Craft GitHub repository, while the supplied AI/ML and Gen-AI template provides the phase-wise project organization.
