6. Project Testing Phase

COMIC CRAFT – AI COMIC STORY USING GEMINI MODEL

• Unit Testing: Test input validation, prompt preparation, response parsing, formatting functions, and individual application components.

• Integration Testing: Test the complete interaction between the user interface, application logic, Gemini API, and result display.

• Functional Testing: Verify that a valid story prompt produces a comic story, scenes are displayed correctly, and errors are handled when generation fails.

• Input Testing: Test empty prompts, very short prompts, long prompts, unusual characters, and unsupported input conditions.

• AI Output Testing: Check whether generated results contain the expected story sections and whether malformed or incomplete responses are handled safely.

• User Interface Testing: Check navigation, readability, buttons, generated content layout, and basic browser compatibility.

• Expected Result: The system should accept a valid idea, communicate with Gemini, generate a structured comic story, and present the result without exposing API credentials.
